

What Is MicroLight Technology?

Q: What is Microlight technology?

A: It is an advanced method of vibrational medicine with many powerful applications for medicine, rehabilitation and esthetics. Microlight technology combines low frequency and low intensity electrical currents with a range of therapeutic colors of visible light. These are delivered through a patented dual probe system that both senses and treats for optimal accuracy and results.

Q: What are the applications of Microlight technology?

A: It provides physicians and practitioners with remarkably effective and rapid results for:

1. Acute and chronic pain relief and pain management – with no drugs or needles
2. Accelerated rehabilitation after injuries, surgery or stroke
3. Helping heal patients with neurological degenerative conditions such as MS, post-stroke and Parkinson's
4. Anti-aging facial and whole-body rejuvenation treatments
5. Support for a wide range of internal medical and emotional conditions

Q: How does Microlight work?

A: It works in a similar way as acupuncture, through the following mechanisms:

1. By removing electrical-energetic blockages in the body that create or aggravate pain
2. Light and currents help harmonize and balance the regulatory systems of the body – neuro-muscular, endocrine and subtle energy – supporting the body in healing itself from the inside out
3. Through lymph clearing, which is vital for resolution of chronic disease and pain processes
4. Boosting cellular ATP levels and promotion of ionic transport through cell membranes
5. Helping the cells and tissues detoxify

Yet Microlight provides superior results to traditional needle acupuncture through the use of color wavelengths, specific frequencies and polarities that the body powerfully responds to. This can be considered the greatest modern advance in the 5000 year old history of acupuncture. Acupuncture practitioners often use Microlight in conjunction with needling, although most report using way less needles than they did before purchasing the equipment.

Q: How does the facial rejuvenation aspect work? What can I expect?

A: It works on two fronts – directly to lift and tone the facial muscles and fascia, and indirectly through the whole-body mechanisms listed above. The Microlight systems of facial rejuvenation are based on the principle that “Inner Balance = Outer Beauty”, that is, that the youthfulness and radiance of the face is a direct reflection of the vitality and health of the internal viscera and glands.

The direct effects of Microlight facial rejuvenation include:

1. Lifting and toning sagging facial musculature
2. Removing the appearance of fine lines and wrinkles, helping reduce deeper wrinkles
3. Helping restore the youthful coloration of the face through improved blood and lymph circulation and internal meridian connections
4. Reducing puffiness and swelling
5. Helping promote healing of acne and rosacea

Q: How fast may I expect for the equipment to pay for itself in my practice?

A: Practitioners who offer rejuvenation services in their practices can expect to recoup the entire cost of the Acutron Mentor Microlight system within 1 – 2 months. One acupuncturist recouped the entire cost of her system with 1 week – by selling 3 packages of 12 prepaid sessions during one open house!
